

# Computer Organization and Software Systems

## CONTACT SESSION 1

Dr. Lucy J. Gudino

WILP & Department of CS & IS

**BITS Pilani**  
Pilani Campus

# Introduction

## Why Study COSS?

# Introduction

Data analytics: is the process of examining data sets in order to draw conclusions about the information they contain, increasingly with the aid of **specialized systems** and **software**.

# Text Books and Reference Books

## Text Books:

- (T1) W. Stallings, *Computer Organization & Architecture*, PHI, 10<sup>th</sup> ed., 2010.
- (T2) A Silberschatz, Abraham and others, *Operating Systems Concepts*, Wiley Student Edition, 8<sup>th</sup> Edition

## Reference Books:

- (R1) Patterson, David A & J L Hennenssy, *Computer Organization and Design – The Hardware/Software Interface*, Elsevier, 5th Ed., 2014.
- (R2) Randal E. Bryant, David R. O'Hallaron, *Computer Systems – A Programmer's Perspective*, Pearson, 3<sup>rd</sup> Ed, 2016.
- (R3) Tanenbaum, *Modern Operating Systems*: Pearson New International Edition, Pearson Education, 2013 (Pearson Online)
- (R4) Stallings, *Operating Systems: Internals and Design Principles*: International Edition, Pearson Education, 2013 (Pearson Online)

# Evaluation Scheme

5 unit course.

Sl No.	Evaluation Component	Duration	Weightage %	Nature of Component
1	Mid Sem Exam	90 min	30%	CB
2	Comprehensive Examination	180 min	40%	OB
3	Quiz	----	5%	OB
4	Assignments	---	25%	OB

# Assignments

- Two assignments:
  - One pre-midsem exam : 12%
  - One post-midsem : 13%
- Lab based
- Simulator to be used : CPU-OS simulator
  - Open source tool  
[https://drive.google.com/open?id=12YUK52RQ-JhPOddj6CD\\_oifW4sTMbsBI](https://drive.google.com/open?id=12YUK52RQ-JhPOddj6CD_oifW4sTMbsBI)
  - Virtual lab (Platify)

# Assignment should not be

# General Instructions

1. Always use note book for writing important points and for solving problems
2. Use chat box for writing subject related questions
3. Do not repeat the questions on chat box. Questions will be answered during last 10 minutes of the session
4. Unanswered questions will be put up on the canvas forum

# Today's Session

Contact Hour	List of Topic Title	Text/Ref Book/external resource
1-2	<b>Introduction to Computer Systems</b> <ul style="list-style-type: none"><li>• Hardware Organization of a computer</li><li>• Running a Hello Program</li><li>• Instruction Cycle State Diagram</li><li>• Operating System role in Managing Hardware</li></ul>	T1

# Definition of a Computer

---

- Is a complex system
- Is a programmable device
- Must be able to **process** data
- Must be able to **store** data
- Must be able to **move** data
- Must be able to **control** above three functions

- Hardware
  - Central Processing Unit (CPU)
  - Memory
  - I/O devices
- Software
  - System Software
    - System Management Software
    - Tools and Utilities for Developing the software
  - Application Software
    - General Purpose Software
    - Specific Purposed Software

# Hardware Organization of a computer

# Running a Hello.c Program

```
#include <stdio.h>
```

```
int main()
```

```
{
```

```
    printf("hello, world\n");
```

```
}
```

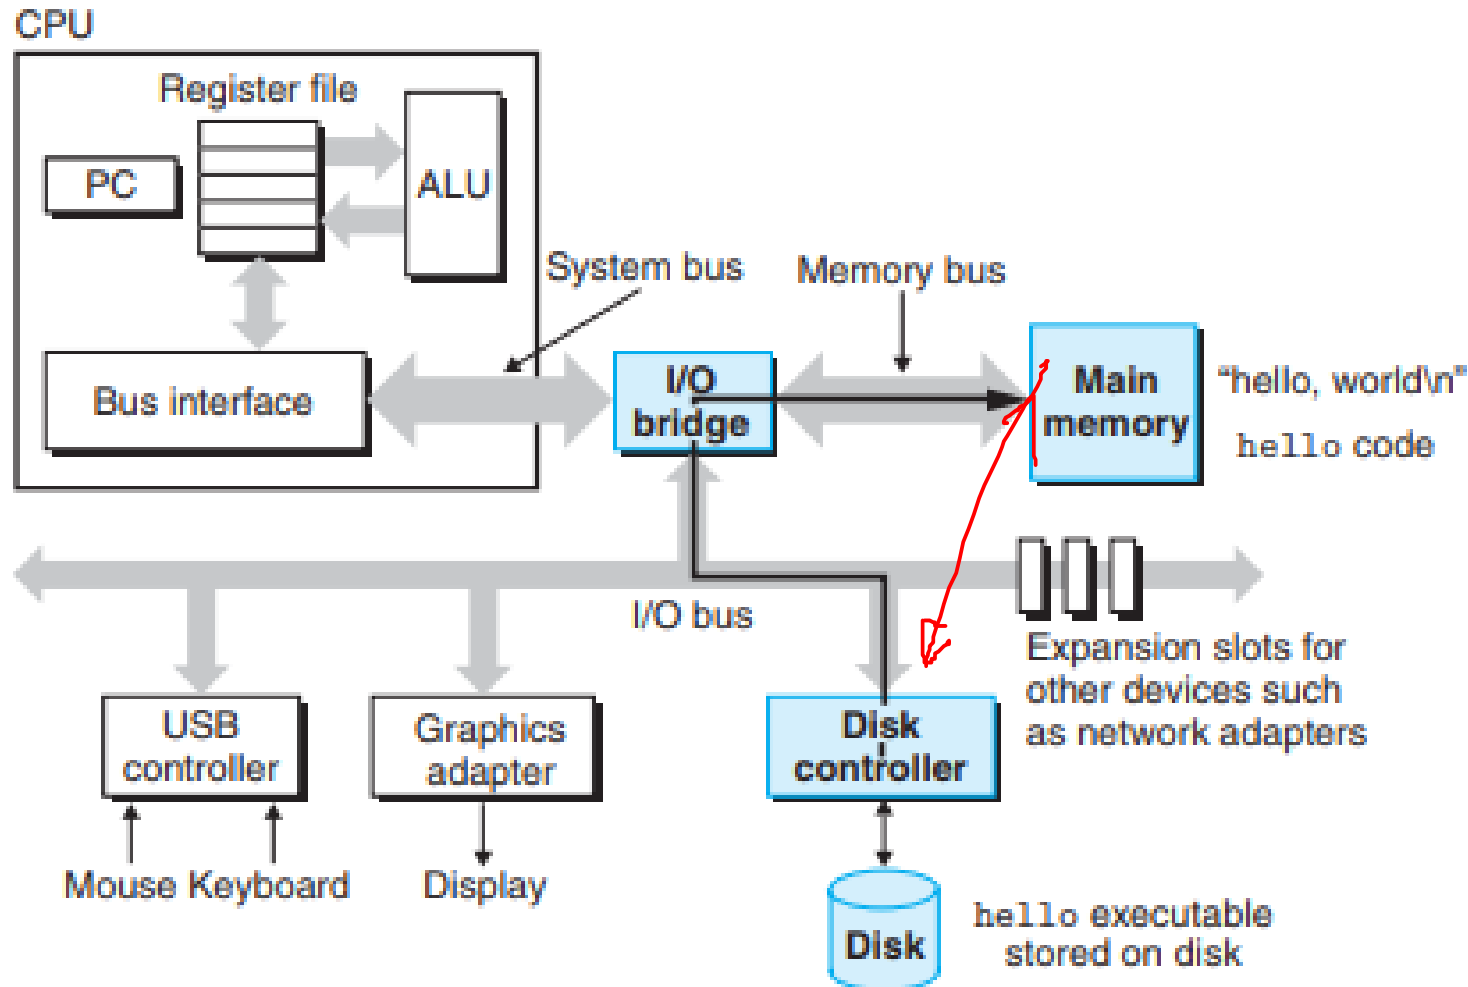

The compilation system.

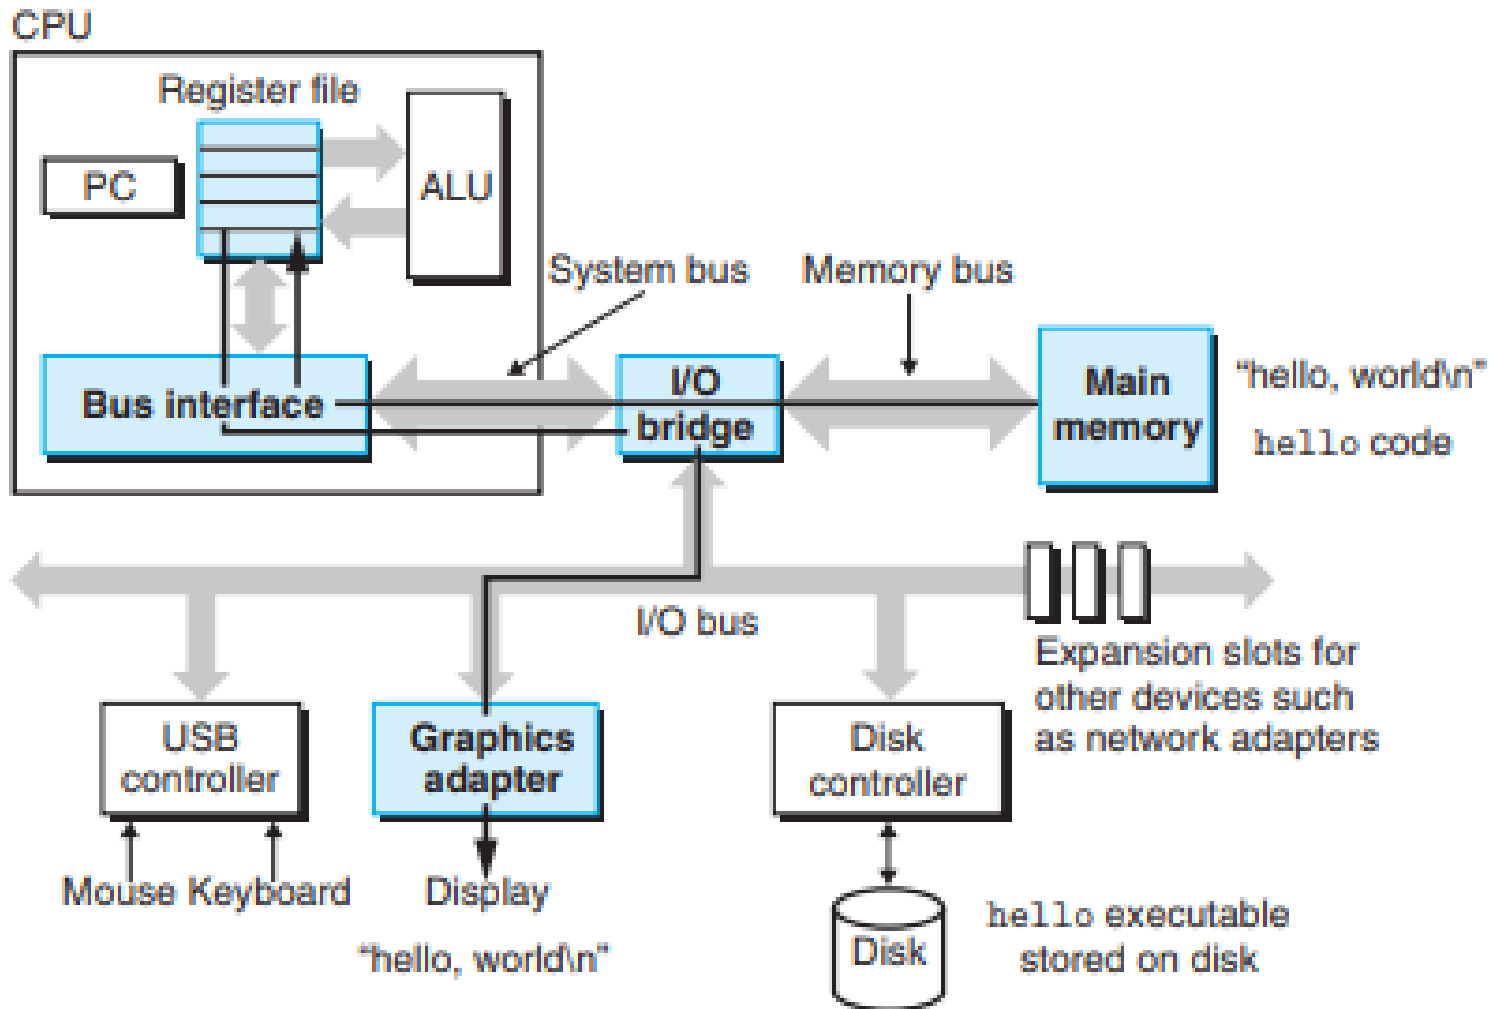

# Reading ./hello command from Keyboard

# Loading the executable from disk into main memory

# Writing the output string from memory to the display

# Why do we need to know how compilation works?

---

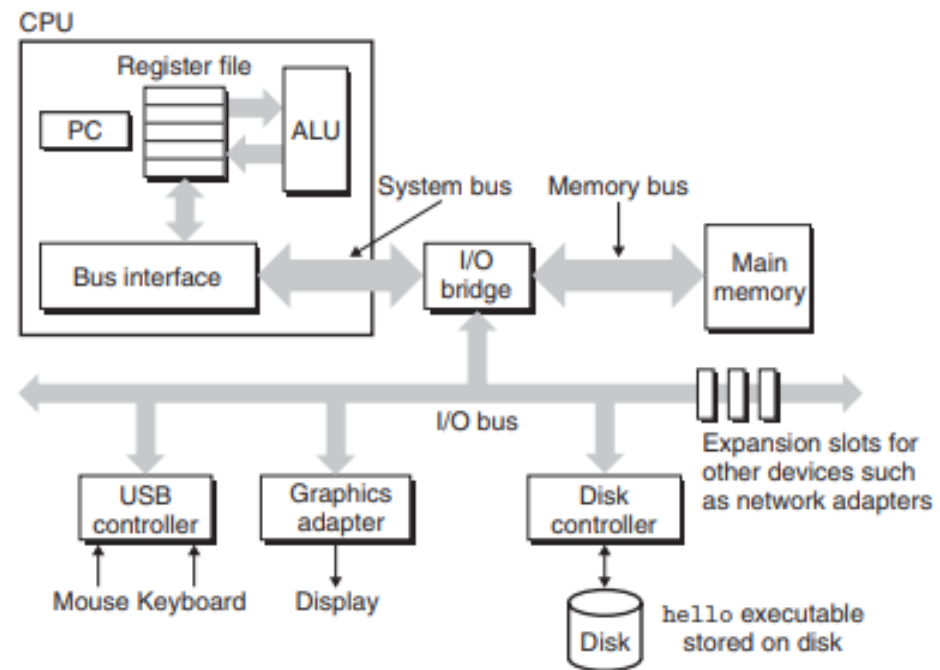

- Optimizing program performance.
- Understanding link-time errors
- Avoiding security holes.

# Von Neumann Architecture

- Three key concepts:
  - Data and instructions are stored in a single read - write memory
  - The contents of this memory are addressable by location, without regard to the type of data contained there
  - Execution occurs in a sequential fashion (unless explicitly modified) from one instruction to the next

# Von Neumann Architecture...

- Stored-program computers have the following characteristics:
  - Three hardware systems:
    - A central processing unit (CPU)
    - A main memory system
    - An I/O system
  - The capacity to carry out sequential instruction processing.
  - A single path between the CPU and main memory.
    - This single path is known as the *von Neumann bottleneck*.
    - Side effect : reduced throughput (Data Rate)

# Harvard Architecture

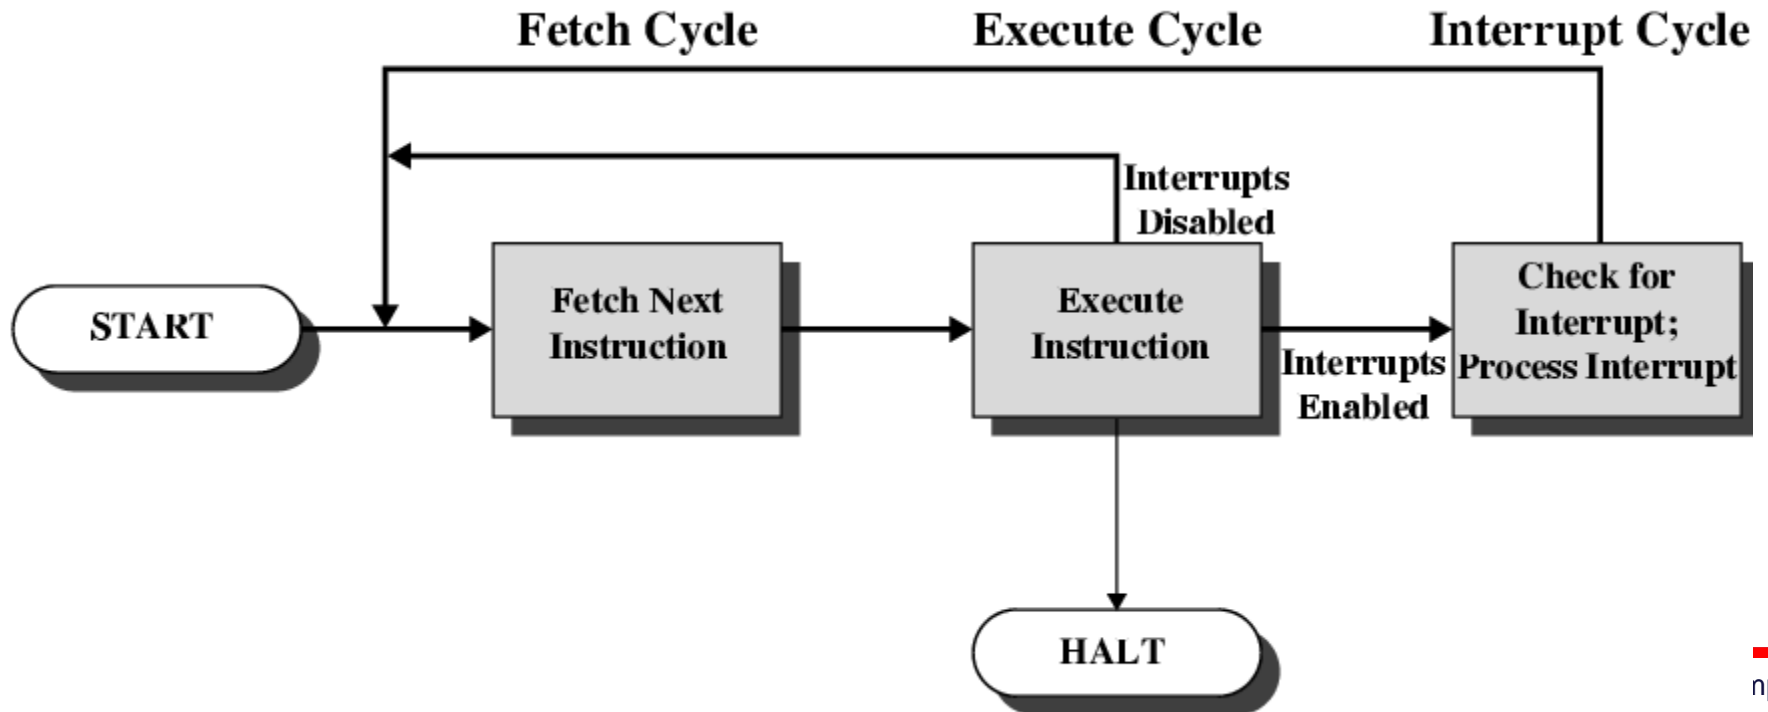

- Uses two memory systems and two separate busses
  - Instruction Memory
  - Data Memory

# Instruction Cycle Diagram

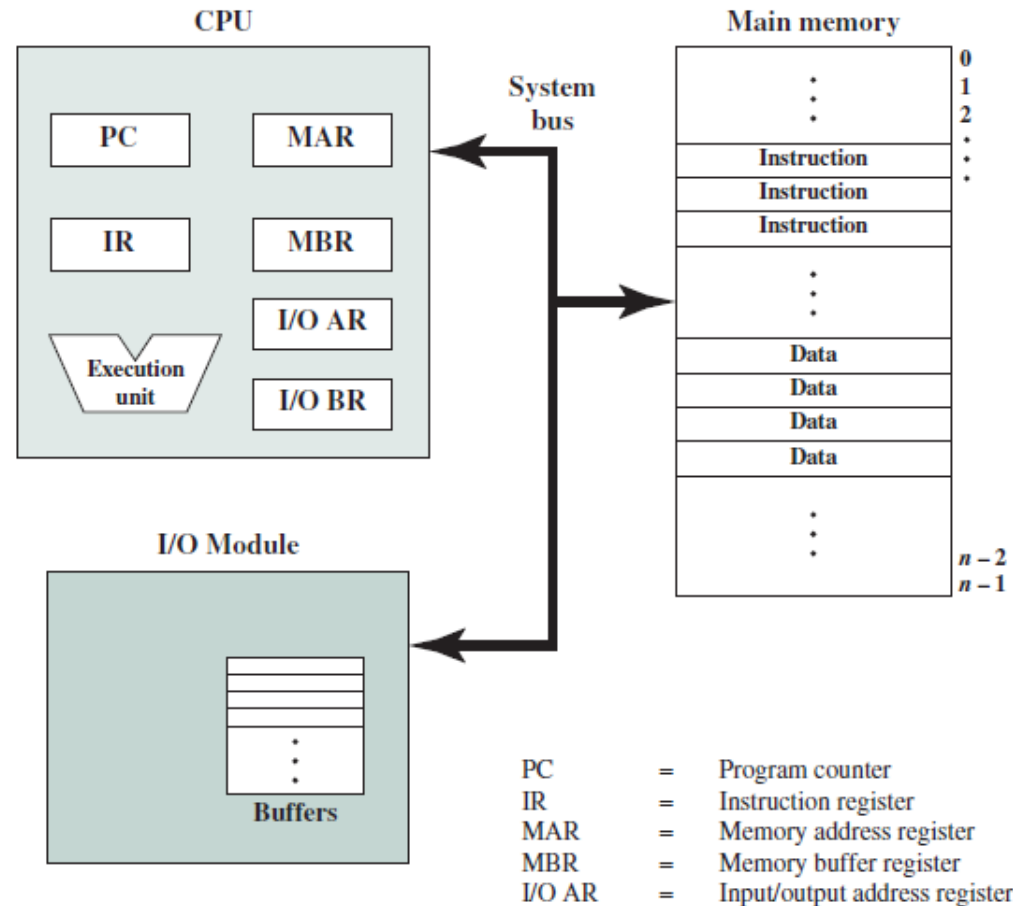

- Instruction execution : Two steps:
  - Fetch
  - Execute
- Interrupt: Interrupt is checked at the end of Instruction cycle

# Fetch Cycle

- Program Counter (PC) holds address of next instruction to be fetched
- Processor fetches instruction from memory location pointed to by PC
- Instruction loaded into Instruction Register (IR)
- Processor interprets instruction and performs required actions during execution cycle
- Increment PC
  - Unless told otherwise

# Execute Cycle

- Processor - memory
  - Data transfer between CPU and main memory
- Processor - I/O
  - Data transfer between CPU and I/O module
- Data processing
  - Some arithmetic or logical operation on data
- Control
  - Alteration of sequence of operations
  - e.g. jump
- Combination of above

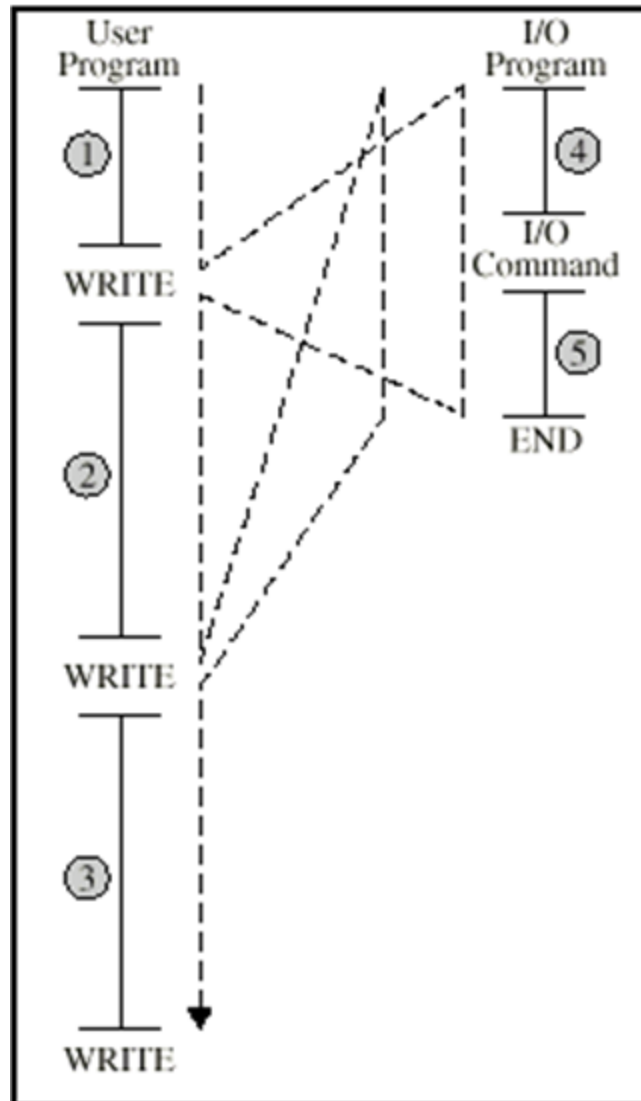

# Interrupt Cycle

- Interrupts: Mechanism by which other modules (e.g. I/O) may interrupt normal sequence of processing
- Interrupts enhances processing efficiency

# Program Flow Control (No Interrupts)

# Program Flow Control (With Interrupts)

# Contd...

- Classes interrupts:
  - Program
    - e.g. overflow, division by zero
  - Timer
    - Generated by internal processor timer
    - Used in pre-emptive multi-tasking
  - I/O
    - from I/O controller
  - Hardware failure
    - e.g. memory parity error

# Interrupt Cycle

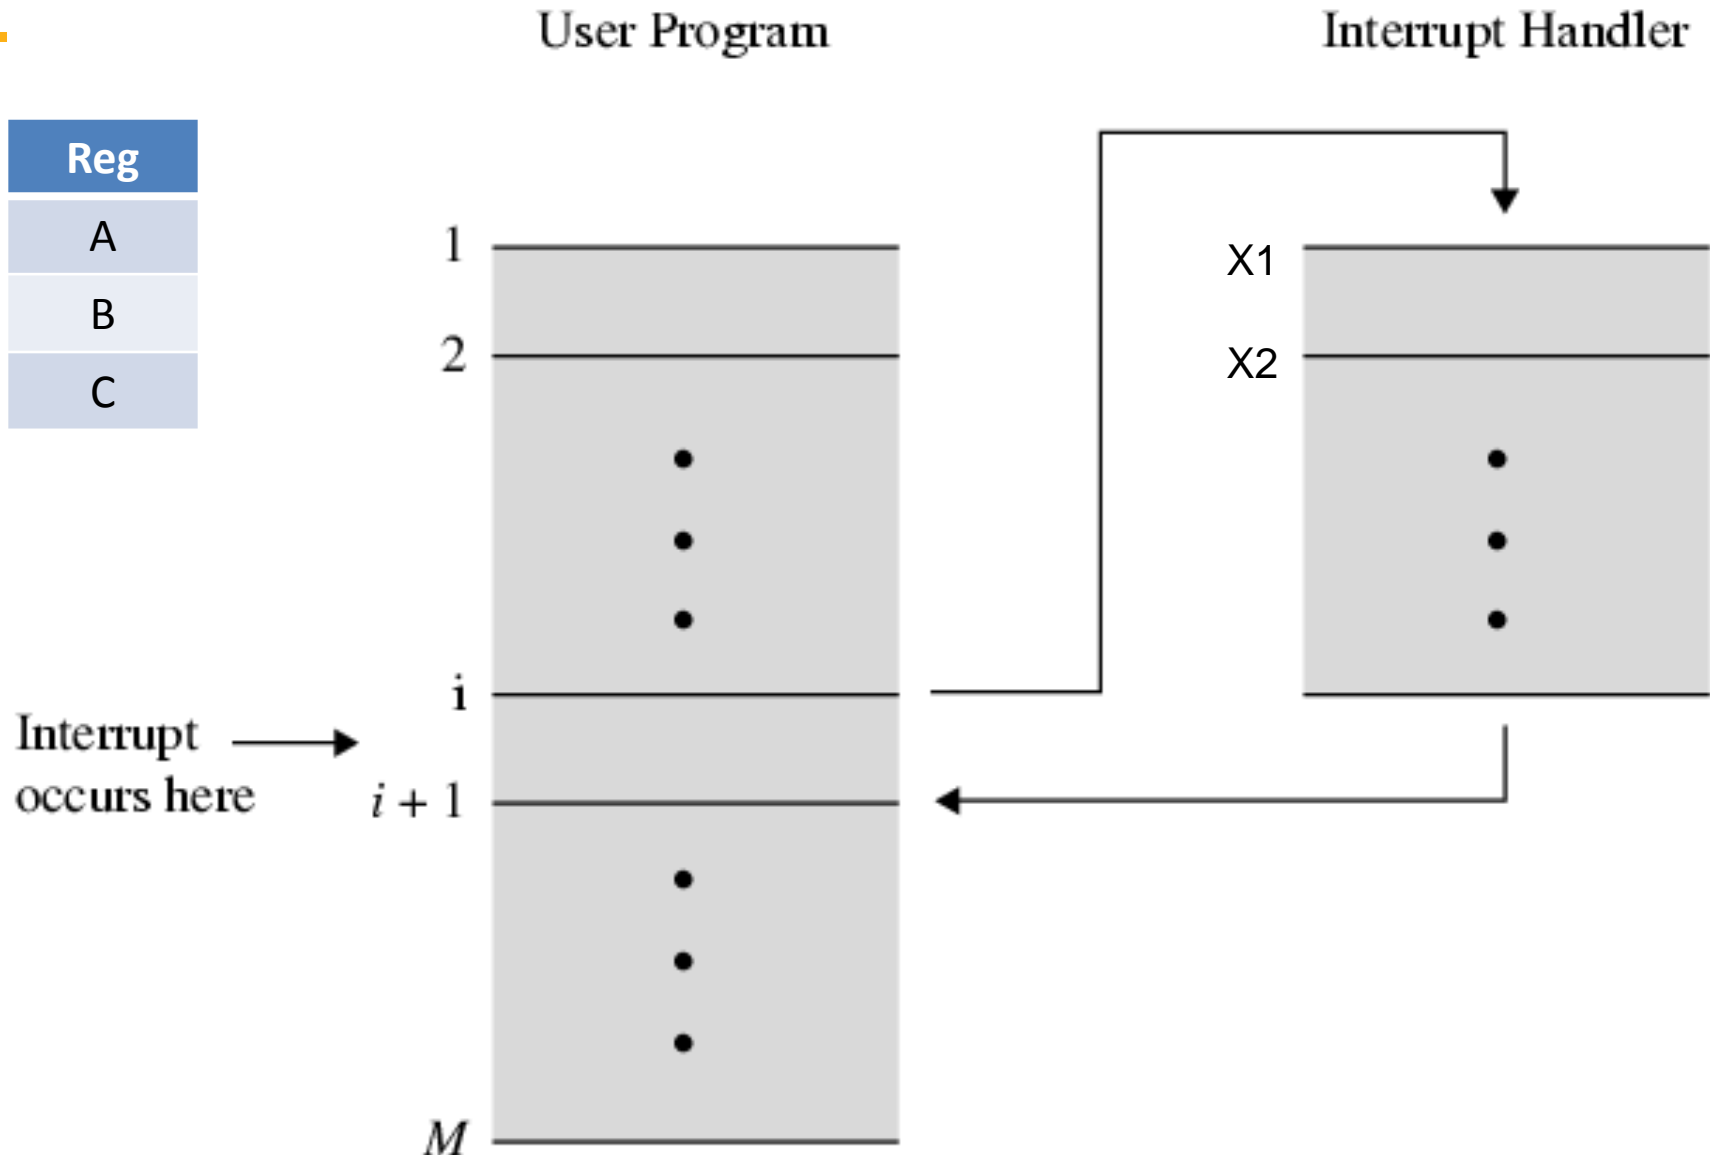

- Processor checks for interrupt
  - Indicated by an interrupt signal
- If no interrupt, fetch next instruction
- If interrupt pending:
  - Suspend execution of current program
  - Save context
  - Set PC to start address of interrupt handler routine
  - Process interrupt
  - Restore context and continue interrupted program

# Transfer of Control via Interrupts

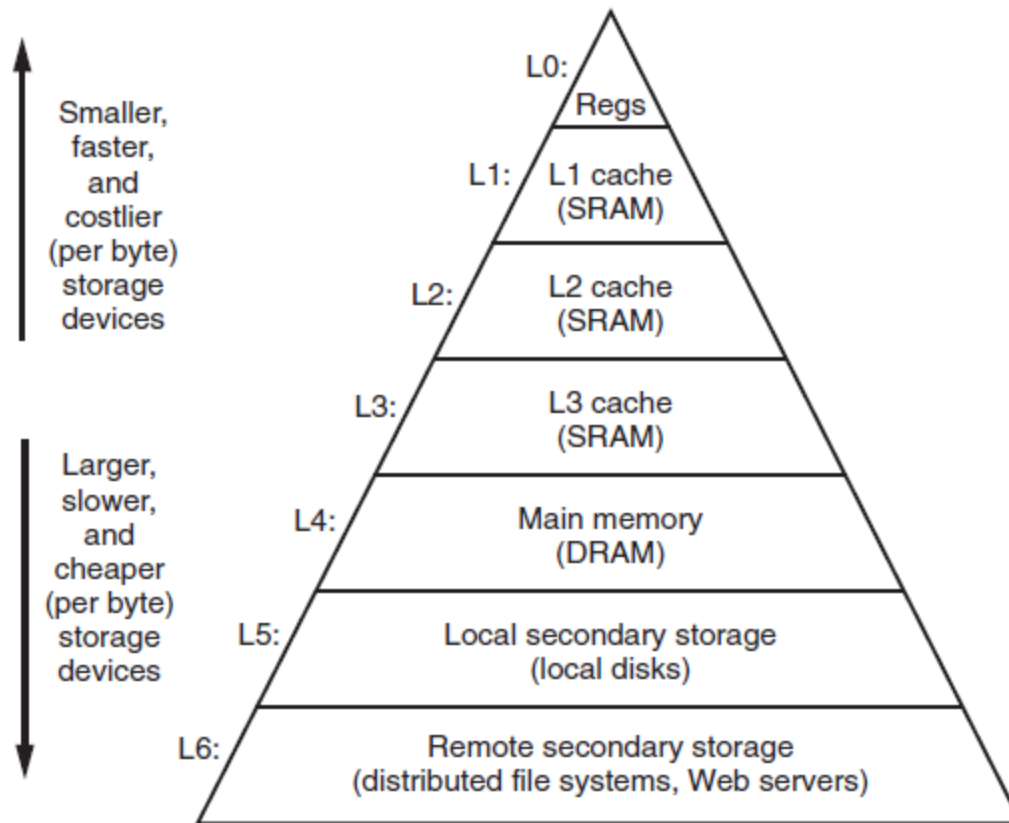

Reg
A
B
C

# Instruction Cycle - State Diagram

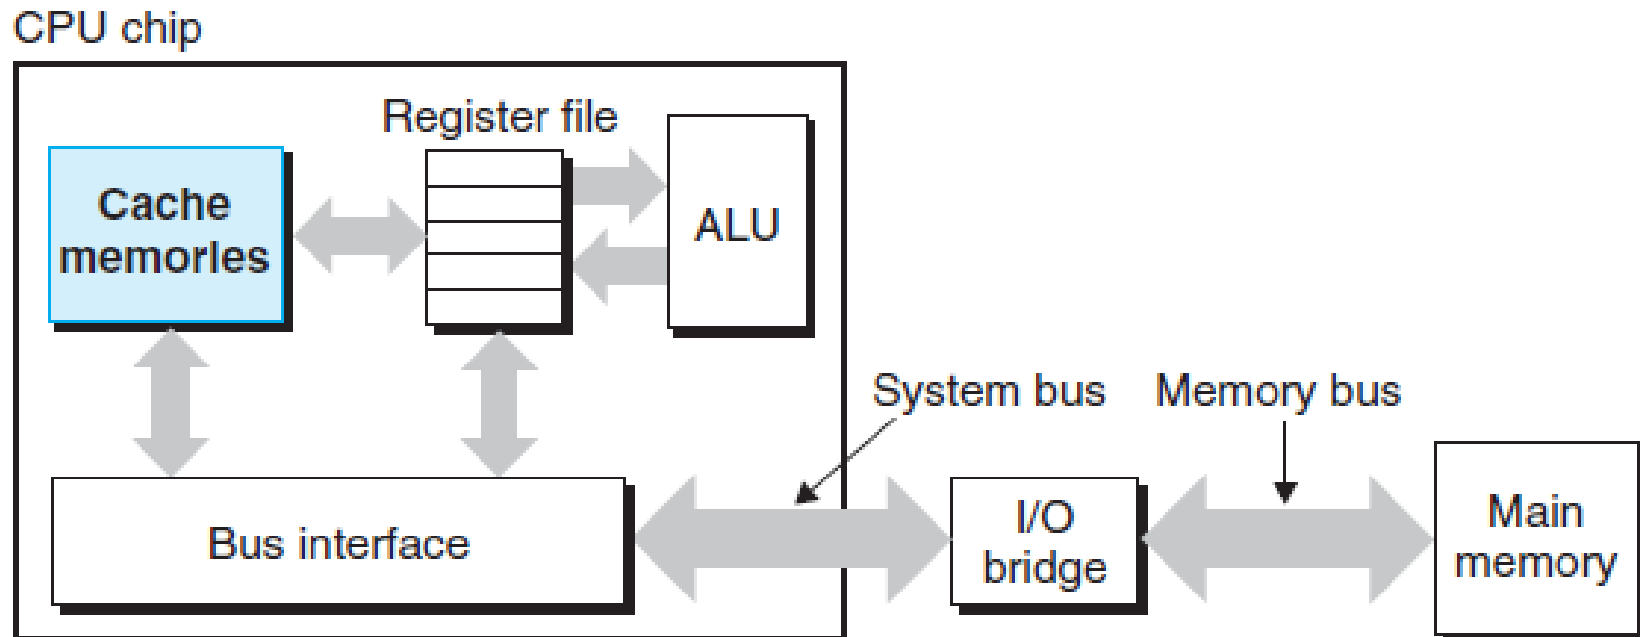

# Memory Hierarchy

An example of a memory hierarchy.

# Role of Cache Memory

# Operating System

- collection of software/ Program that acts as an intermediary between an user of a computer and the computer hardware.
- is a program that helps to run all the other programs
- Three main functions:
  - Resource management
  - Establish an user interface
  - Execute and provide services for application software

Layered view of a computer system.

# Main objectives

- Convenience
- Efficiency
- Ability to evolve and offer new services
- Maximize System performance
- Protection and access control
- Footprint of OS should be small

# Important Note

- “The one program running at all times on the computer” is the **kernel**. Everything else is either a system program (ships with the operating system) or an application program
- **bootstrap program** is loaded at power-up or reboot
  - Typically stored in ROM or EPROM, generally known as **firmware**
  - Initializes all aspects of system
  - Loads operating system kernel and starts execution

# Operating System Operations

- **Dual-mode operation**
  - User mode
  - Kernel mode ( also known as System Mode / Supervisor mode/ privileged mode )
- User mode(1):
  - user program executes in user mode
  - certain areas of memory are protected from user access
  - certain privileged instructions may not be executed
- Kernel Mode (0)
  - privileged instructions may be executed
  - protected areas of memory may be accessed

# Transition from user to kernel mode
